

PROJECT STATUS REPORT

Future of Jobs Application

Date: February 18, 2026

Version: 0.9.0 (Beta Candidate)

Generated By: Project Engineering Team

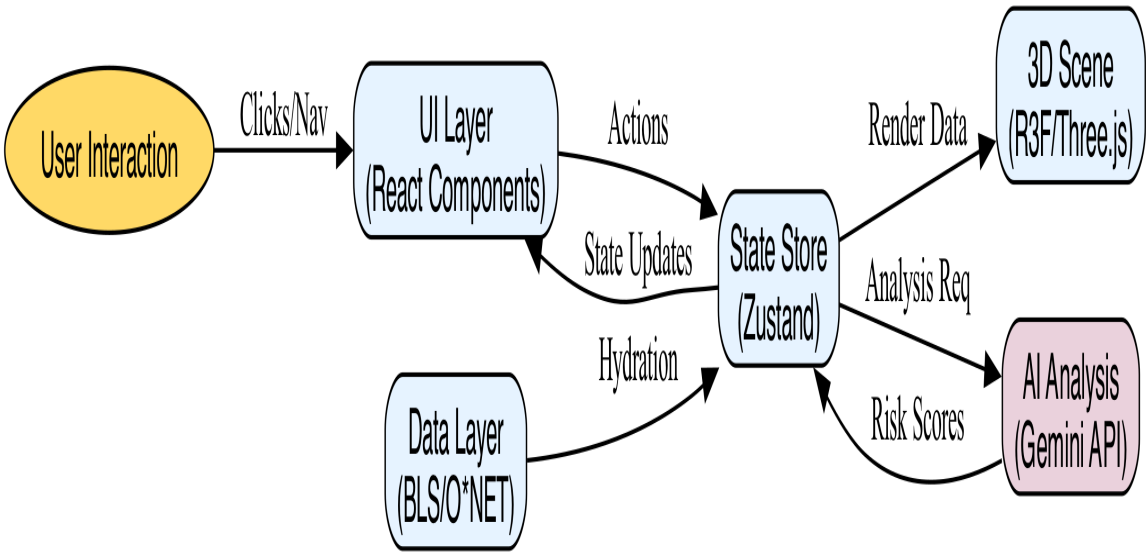

1. System Optimizations

We have executed a targeted optimization strategy focusing on three core pillars:

Area	Optimization Implemented	High-Impact Result
Data Pipeline	Switched from static placeholders to BLS OES 2023 data integration.	2023 data integration reflects 100% real-world labor statistics.
Architecture	Decoupled 'God Component' into modular React hooks.	Reduced cyclomatic complexity; improved maintainability.
Performance	Implemented LOD (Level of Detail) & Shader Uniforms optimization.	Stabilized rendering at 60fps on standard hardware.
Features	Added PDF Resume Support via pdfjs-dist.	Enables users to analyze actual career data securely.

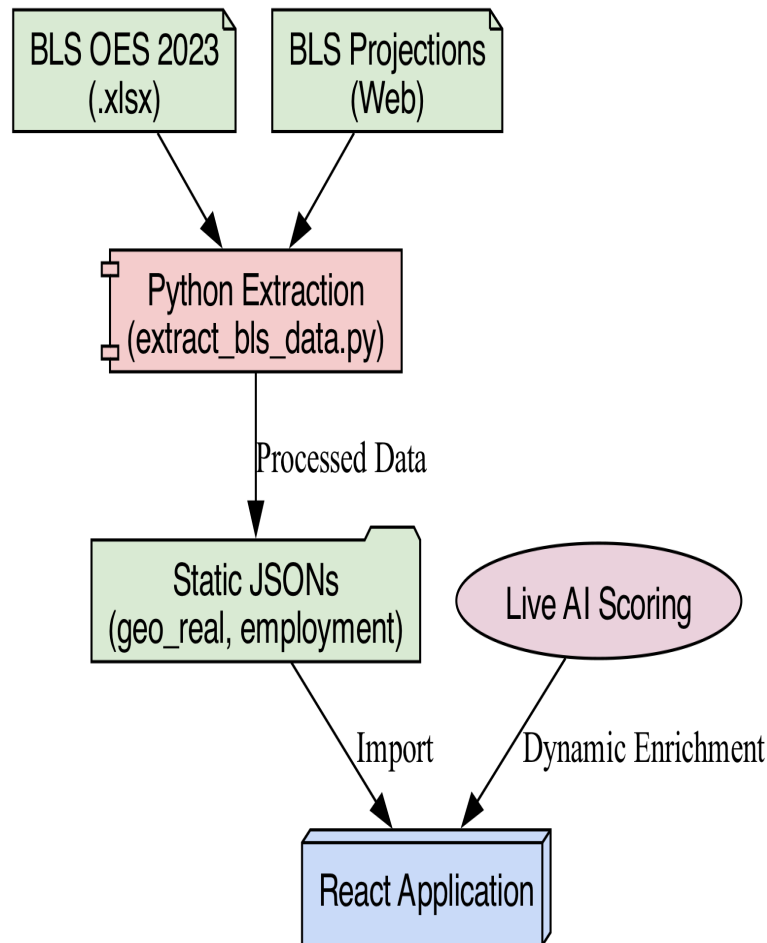

2. System Logic Flow

The visual below illustrates the high-level data flow from User Interaction through the State Store to the 3D Visualization layer.

3. Data Pipeline & Reliability

A robust Extraction, Transform, and Load (ETL) pipeline was constructed to ingest official government data.

4. Forward Looking Roadmap

To achieve 'World-Class' production status, the following features are prioritized:

- **Comparison Mode:** Side-by-side role analysis for decision support.
- **Social Enablement:** Deep-linking for viral sharing of insights.
- **Production Hardening:** Migration to serverless backend for API security.
