AI & Future of Work: Student Feature Guide

futureofjobs.vercel.app · Data: BLS EP & OEWS, O*NET 30.1, Anthropic Claude

This guide explains every feature of the **AI & Future of Work** visualisation tool. It covers all 830 BLS occupations, in every field, to help you analyse how artificial intelligence is reshaping work, so you can make strategic decisions about your career or studies.

01 🏔️ 3D Terrain Map

The map is one landscape split into 22 fields: the BLS major occupation groups, from Arts & Media to Healthcare and Construction. A field's area is its share of all U.S. workers in 2025 (BLS Employment Projections, self-employed included). The fields are grouped by the five official BLS job families, outlined on the map: area is workers, while positions within a family follow BLS code order, so where a field sits and its shape are only layout. Each peak is one occupation, and its height is its number of jobs from BLS Employment Projections. Open a family or a field and it gets a landscape of its own, on one fixed scale: the largest job count any of its occupations reaches from 2025 to 2035 is full height. Each hill rises or falls with its own BLS number as you move the slider, though a small hill on a larger neighbour's slope can move with that neighbour. Compare heights within what you have open.

Student tip: Click a job family to see it on its own, then a field to see its occupations, or pick any field from the Fields list. The largest are labelled; hover or tap any other peak for its name. Back, Esc or the trail at the top takes you back up.

02 ⏱️ AI Timeline Slider

Drag the slider from 2025 → 2035 to watch each occupation's BLS Employment Projections job count year by year. Height moves in a straight line between the official 2025 and 2035 employment levels — no AI forecast on the landscape.

Student tip: Compare Registered Nurses with Retail Salespersons at 2035. Notice which peak grows and which shrinks, then open both to compare.

03 🎓 Fields & Kelley Roles

AI scores cover the 50 Kelley business roles plus every Business & Finance occupation, so that whole field is in colour. Turn on Kelley roles to highlight just the 50 Kelley roles, with their risk colours, as the map showed them before; the other Business & Finance occupations are scored but are not Kelley roles. Every other occupation is drawn in slate: its AI scores are coming soon, and nothing is shown in their place.

Student tip: Search any job title in the header: all 830 BLS occupations are there, from Actors to Electricians.

04 📋 Job Detail Panel

Inside a field, click any peak to open its panel: what the job involves (O*NET), how many people do it (BLS Employment Projections, 2025, self-employed included), median pay (BLS OEWS, payroll employees only), the BLS 2025–35 growth outlook, and its day-to-day O*NET tasks. For the 50 Kelley roles the panel also shows Automation Risk, Human Criticality and Human Resilience, with a risk score on every task. Automation Risk is the plain average of those task scores, so you can check it yourself. Every other Business & Finance occupation shows the same scores on its five rated tasks, and says where it would sit among the 50 Kelley roles.

Student tip: Two worker counts are normal: pay comes from payroll employees only, while "workers" counts everyone, self-employed included. Scores measure GenAI capability, not guaranteed adoption.

05 🧩 Tasks View

Open Tasks in the header to see each Kelley role broken into AI-capable vs human-needed work (other occupations are not in it yet). Roles are ordered by average GenAI capability today — not guaranteed adoption. Use “Same score, different jobs” pairs to make the contrast concrete.

Student tip: Capability labels are Claude judgments of what GenAI can handle, not a forecast that the work is already automated.

06 🤖 AI Analysis

Open any of the 50 Kelley roles and Claude explains its published scores right in the panel: the reasoning under each task, a strategic insight for the role, and the likely replacements and human traits it calls for. The analysis adds the explanation; it never changes the numbers. The Business & Finance occupations outside the 50 show their published scores with no live analysis, and occupations without published scores have no analysis yet.

Student tip: Every student sees the same published scores for a role, dated in the header badge, so you can compare notes. The analysis is where you get the why behind them.

07 🔮 Scenario Planning

On a Kelley role, the Scenario button asks "what if": what happens to this role if AI adoption accelerates, if regulation tightens, or if economic conditions shift? It generates a written strategic brief.

Student tip: Use this to stress-test career choices. Ask the same role under two different scenarios and compare the outlooks.

08 🗺️ Career Roadmap

On a Kelley role, identifies the highest-risk task and builds a personalised 6-month plan to defend it — own the judgment and oversight around the automatable work — while deepening a human-critical task. Covers skills, tools, and learning resources.

Student tip: Open it with the Roadmap button on the role panel. Defend = supervise the high-risk task; Build = deepen the human-critical one.

09 🎯 My Skills (CV Match)

Paste your CV or a list of your skills. The app analyses which roles align with your strengths and flags where you are most exposed to automation risk.

Student tip: Honest input = honest output. List the skills you actually have, not the ones you wish you had.

10 🗺️ US Map View

Switch from the 3D terrain to a flat 2D US map of the 50 Kelley roles (state data for other occupations is not in the app yet). State colour and circle size both encode BLS employment volume: darker and larger means more workers in that state for the selected roles. Hover a state to see the exact BLS OEWS May 2025 employment count and Location Quotient (LQ) per occupation.

Student tip: Select specific roles using the role filter before opening the map to compare which states are most exposed for those jobs in particular.

11 📊 Job Security Index

The colour legend at the bottom right of the screen maps the scored roles into three bands: High Automation Risk (red), Hybrid/Augmented (amber), and Safe Human-Centric (green). Bands are relative, graded on a curve across the 50 Kelley roles; the other Business & Finance occupations are placed on that same curve. Slate peaks are occupations with no AI scores yet.

Student tip: A "green" role here means it is safer than most others in this dataset, not that it is completely immune to automation.

12 📚 Data Sources

Workers in each occupation and each field come from the BLS Employment Projections 2025–35, which count everyone, self-employed included; growth outlooks come from the same projections. Pay comes from the BLS Occupational Employment & Wage Statistics (OEWS, May 2025), which covers payroll employees only. Task descriptions are from O*NET 30.1. AI risk scores are Claude's ratings of each O*NET task for the 50 Kelley roles and every other Business & Finance occupation, published with the app, so every student sees the same numbers; scores for the other occupations are coming soon.

Student tip: Click "Sources" at the bottom of the screen to read the full sourcing and calculation methodology.
