

AI & Future of Work: Student Feature Guide

futureofjobs.vercel.app · Data: BLS OES, O*NET 30.1, Anthropic Claude

This guide explains every feature of the **AI & Future of Work** visualisation tool. Each feature is designed to help you analyse how artificial intelligence is reshaping specific job roles, so you can make strategic decisions about your career or studies.

01 3D Terrain Map

Each glowing peak represents one job role. Peak colour = AI automation risk (red = high risk, green = safe). Peak height depends on the mode: in Growth mode it reflects the projected employment change %; in Workers mode it reflects the implied BLS headcount at that year.

Student tip: Toggle the height mode with the switch on the year-slider panel. Workers mode shows which roles employ the most people right now; Growth mode shows where change is happening fastest.

02 AI Timeline Slider

Drag the slider from 2025 → 2030 to watch each role's projected employment change year by year. Every peak follows its role's published forecast, which stays within the official BLS 2024–34 outlook for that occupation.

Student tip: Compare a Marketing Manager to a Sales Manager at 2030. Notice which peak moves more, then open both roles to compare their task-level risk.

03 Job Detail Panel

Click any peak to open a role's full profile: its Automation Risk, the BLS 2024–34 growth outlook, its Human Resilience rank among all 50 roles, and its projected jobs path to 2030. Below that, each of the role's O*NET tasks appears with its own risk score. Automation Risk is the plain average of those task scores, so you can check it yourself.

Student tip: The "Human Skills" section shows what AI cannot easily replace. These are the tasks worth developing.

04

AI Analysis (Analyze)

Tap the Analyze button on any role and Claude explains its published scores: the reasoning behind each task's score, a strategic insight for the role, and the likely replacements and human traits it calls for. Analyze adds the explanation; it never changes the numbers.

Student tip: Every student sees the same published scores for a role, dated in the header badge, so you can compare notes. Analyze is where you get the why behind them.

05

Scenario Planning

The Scenario button asks "what if": what happens to this role if AI adoption accelerates, if regulation tightens, or if economic conditions shift? It generates a written strategic brief.

Student tip: Use this to stress-test career choices. Ask the same role under two different scenarios and compare the outlooks.

06

Career Roadmap

Identifies the highest-risk task in a role and builds a personalised 6-month upskilling plan to move away from it, covering specific skills, tools, and learning resources.

Student tip: Open it with View Roadmap at the bottom of the Job Detail Panel. The plan pairs that role's highest-risk task with its most human-critical one.

07

My Skills (CV Match)

Paste your CV or a list of your skills. The app analyses which roles align with your strengths and flags where you are most exposed to automation risk.

Student tip: Honest input = honest output. List the skills you actually have, not the ones you wish you had.

08

US Map View

Switch from the 3D terrain to a flat 2D US map. State colour and circle size both encode BLS employment volume: darker and larger means more workers in that state for the selected roles. Hover a state to see the exact BLS OEWS May 2025 employment count and Location Quotient (LQ) per occupation.

Student tip: Select specific roles using the role filter before opening the map to compare which states are most exposed for those jobs in particular.

09

Job Security Index

The colour legend at the bottom right of the screen maps roles into three bands: High Automation Risk (red), Hybrid/Augmented (amber), and Safe Human-Centric (green). Bands are relative, graded on a curve across all 50 roles shown.

Student tip: A "green" role here means it is safer than most others in this dataset, not that it is completely immune to automation.

10

Data Sources

Employment numbers come from the Bureau of Labor Statistics (BLS) Occupational Employment & Wage Statistics, and growth outlooks from the BLS 2024–34 Employment Projections. Task descriptions are sourced from O*NET 30.1. AI risk scores are Claude's ratings of each O*NET task, published with the app as one dated set, so every student sees the same numbers.

Student tip: Click "Methodology & Data" at the bottom of the screen to read the full sourcing and calculation methodology.
